CUSTOMER WARRANTY

Tractors, Attachments & Accessories

Subject to the warranty terms and conditions set forth herein AVCO NEW IDEA Farm Equipment Division, AVCO Distributing Corporation warrants its lawn and garden products to be free from defects in material or workmanship for a period of (1) year in ordinary home use (3 months if in commercial or institutional use) following the date of sale to the original purchaser.

Power Pack (Batteries)

Subject to the warranty terms and conditions set forth herein AVCO NEW IDEA Farm Equipment Division, AVCO Distributing Corporation warrants that it will replace any individual garden tractor power pack unit with which this warranty is furnished if it fails because of defects in material or workmanship for:

12 Volt Power Pack — 1 year full warranty and 2 year pro rata for ordinary home use (6 months in commercial or institutional use) following the date of sale to the original purchaser. After 1 year in home use, but within 36 months following the date of purchase a power pack will be replaced at a pro rata service charge equal to 1/36th of the list price for replacement unit multiplied by the number of months which have elapsed from the date of original purchase to the date of failure.

The charge for service labor during the first (1) year in ordinary home use (3 months if in commercial or institutional use) will be covered under warranty. Service labor after the first (1) year is the responsibility of the owner.

A replacement unit will carry the above (1) year warranty and thereafter will be considered to be installed on the same date as the other units in the power pack for pro rata adjustment.

6 Volt Power Pack — 2 year full warranty and 3 year pro rata for ordinary home use (6 months in commercial or institutional use) following the date of sale to the original purchaser. After 2 years in home use, but within 60 months following the date of purchase, a power pack will be replaced at a pro rata service charge equal to 1/60th of the list price for replacement unit multiplied by the number of months which have elapsed from the date of original purchase to the date of failure.

Power Pack (Batteries) Cont.

The charge for service labor during the first (1) year in ordinary home use (3 months if in commercial or institutional use) will be covered under warranty. Service labor after the first (1) year is the responsibility of the owner.

A replacement unit will carry the above (2) year warranty and thereafter will be considered to be installed on the same date as the other units in the power pack for pro rata adjustment.

WARRANTY TERMS

Any parts that are proved, in the Company's judgment, to be defective during the above period will be repaired or replaced, free of charge and without charge for installation, at the place of business of an AVCO NEW IDEA Lawn and Garden Dealer. It is the purchaser's obligation to bring the product or parts to the Dealer's place of business. If this is not possible, it is the purchaser's obligation to reimburse the Dealer for travel time and travel expenses incurred in fulfilling this warranty.

The Dealer will properly set up and adjust the product at time of delivery. This warranty shall not entitle the purchaser to any further adjustments or normal maintenance services.

The warranty shall not apply to any Garden Tractor, Power Pack, accessories or attachments which have been repaired or altered in any way so as, in the Company's judgment, to affect its reliability, or which has been subject to misuse, negligence or accident, or attachments mounted on tractors which are not included in the Company's approved list, or repair parts which have not been approved by the Company for use in connection herewith.

THE ONLY REMEDY FOR ANY BREACH OF WARRANTY AND THE ONLY REMEDY FOR THE COMPANY'S LIABILITY OF ANY KIND, INCLUDING LIABILITY FOR NEGLIGENCE, WITH RESPECT TO ANY PRODUCT, SHALL BE LIMITED TO THE REPAIR OR REPLACEMENT OF ANY DEFECTIVE PARTS AS STATED ABOVE, AND SHALL IN NO EVENT INCLUDE ANY INCIDENTAL OR CONSEQUENTIAL DAMAGES.

THIS WARRANTY IS IN LIEU OF ANY OTHER WARRANTY, EITHER EXPRESSED OR IMPLIED.
The Electric Garden Tractor is the result of careful design engineering with features such as: safety, ease of operation, economy, ruggedness and maintenance-free features.

Electricity is the cleanest most dependable and economical source of power.

It is Very Important that Each Operator Fully Understand the Controls, Safety and Maintenance of their Garden Tractor. Read the Operator's Manual Carefully.

SAFETY

BE ALERT!

SAFETY IS IN YOUR HANDS

SAFETY PRACTICES

As with all power devices, prime responsibility for safe operation of the equipment rests with the operator. It is necessary that both operating instructions and the following safety information be fully understood by each operator before using the tractor and attachments.

- Become familiar with the location and function of all controls.
- Be sure the work area is clear of objects such as stones, metal objects, or sticks, which might be picked up and thrown by the mower.
- Regulate travel speed according to ground conditions.
- Don’t forget to set the brake and shut off attachment power before you leave the tractor.
- Don’t drive too close to creeks or ditches, in order to avoid the chance of tipping.
- Watch out for traffic when near roadways.
- Vehicles and attachments should be stopped and inspected after striking a foreign object and any damage should be repaired before re-starting and operating the equipment.
- Mow up and down the face of slopes; never across the face.
- Stay alert for holes and other hidden hazards.
- Watch where you’re driving! Pay attention! The tractor is heavy and very powerful.
- Beware of steep slopes! Reduce speed on all side slopes and sharp turns to prevent tipping or losing control.
- Don’t attempt to operate tractor when not in seat.
- Don’t carry passengers without proper provisions.
- Keep people and pets at a safe distance, especially in the direction of mower discharge.
- Don’t wear loose-fitting clothing that might get caught in moving parts.
- Never attempt to get off the tractor while it is in motion.

- Don’t stop or start suddenly when going uphill or downhill. A sudden change of speed could upset the balance of tractor or operator.
- Keep tractor in good operating condition. Maintain all safety devices as indicated in this manual.
- Plug tractor charger cord into a normal 115-volt 3-hole grounded receptacle. Do not use a 2-hole adapter unless properly grounded.
- Keep hands and feet clear of all rotating equipment.
- Disconnect power cord connections from tractor to attachment before handling or servicing power attachments.
- All safety devices are for your protection. Do not attempt to defeat them.
- Shut off power to attachments when transporting or not in use for safety and to conserve power.
- Take all possible precautions when leaving vehicle unattended; such as turning PTO switch to “Off”, lowering attachments, setting parking brake, and removing key.
- Keep motors free of grease, leaves, or grass to prevent heat build-up.
- Use care when pulling loads or using heavy equipment.
  
  Use only approved drawbar hitch points.
  Limit loads to those you can safely control.
  Do not turn sharply. Use care when backing.

- When using any attachments, never direct discharge of material toward bystanders or allow anyone near vehicle in operation.

- When using tractor with mower:
  
  Mow only in daylight or in good artificial light.
  Check blade mounting bolts for proper tightness at frequent intervals.

- Keep all guards in place on mower.

## TROUBLESHOOTING CHECK LIST

<table>
<thead>
<tr>
<th>Indication</th>
<th>Possible Causes</th>
</tr>
</thead>
</table>
| • Drive motor does not run and fuel level gage* does not indicate in the green zone. | • Large circuit breaker “open”. Push to reset.  
• Key switch not turned to “On”.                                                |
| • Drive motor does not run, but fuel level gage* indicates in green zone.  | • Seat switch not operating properly.  
• Clutch switch does not close when the clutch/brake pedal is depressed.         |
| • Mower (PTO) inoperative, but drive motor runs.                           | • Proper PTO starting sequence not followed.  
• PTO switch not moved from “Start” to “Run” position after starting motors.  
• Mower motor power cord connectors not joined.                                |
| • Reduced tractor range.                                                   | • Charger not started at proper dial setting.  
• Brake dragging. Readjust caliper unit.  
• Drive belt slipping due to adjustment or wear.  
• Power pack electrolyte level low.  
• Tires underinflated.  
• Failure to fully release clutch/brake pedal on long runs.  
• Improper lubrication.  
• Improper range selection. (Also lower range).                               |
| • Power Pack not charging.                                                 | • Charger not plugged into 115-VAC outlet.  
• 115-VAC outlet inoperative due to open household fuse or circuit breaker.  
• Failure to start charger at proper dial setting.                            |
| • Accessory tools* inoperative.                                            | • Tool plug not locked into accessory receptacle.  
• Tool power cord or plug defective.                                           |

*EGT80 Model - Optional.

OPERATION AND ADJUSTMENTS

WARNING:
OPERATOR SHOULD NOT RELEASE CLUTCH/BRAKE PEDAL QUICKLY IN STARTING. THIS PRACTICE DRAWS HIGH CURRENT THROUGH THE DRIVE MOTOR AND CAN ALSO RESULT IN A SUDDEN SNAP START. THE ELECTRIC TRACTOR IS MUCH THE SAME AS AN AUTOMOBILE; IT IS A POWERFUL MACHINE WHICH MUST BE HANDLED WITH CARE AND JUDGMENT. SPECIAL CARE IN STARTING AND BRAKING ON HILLY TERRAIN IS IMPERATIVE FOR SAFE OPERATION SINCE THE BALANCEhifts TO MAKE THE MACHINE LESS STABLE AS THE ANGLE OF GROUND INCREASES. SUDDEN STARTS UPHILL OR STOPS WHEN ROLLING DOWNHILL COULD UPSET STABILITY AND CAUSE POSSIBLE DAMAGE TO THE EQUIPMENT OR INJURY TO THE OPERATOR.

IT SHOULD ALSO BE NOTED THAT A TRACTOR WILL CLIMB A STEEPER HILL THAN IT CAN SAFELY DESCEND, DUE TO THE SHIFT OF WEIGHT BALANCE WHICH RESULTS IN MORE TRACTION UPHILL BUT MUCH LESS REAR WHEEL GRIP DOWNHILL. STARTING SHOULD BE DONE BY SLOWLY RELEASING CLUTCH/BRAKE PEDAL UNTIL FULL FORWARD MOTION OCCURS. THE PEDAL SHOULD THEN BE FULLY RELEASED. DOWN SHIFTING TO A LOWER GEAR RANGE MAY BE NECESSARY IF THE STARTING LOAD IS HIGH OR IF THE TRACTOR SLOWS AFTER STARTING. RESTING YOUR HEEL ON FOOT-REST AND TIPPING FOOT AWAY FROM PEDAL CAN AID IN SLOW, SOFT, STARTS.

FIG. 2 - TO START
1. Operator must be seated in the seat.
2. Turn key switch to “On”.
3. Fully depress clutch/brake pedal which will start drive motor and prevent tractor motion.
4. Move range selector to desired position (L, D1, or D2). A slight release of clutch will facilitate shifting.
5. Slowly release clutch/brake pedal.
6. When forward motion occurs, fully release pedal.

NOTE:
FULL DEPRESSION OF THE CLUTCH/BRAKE PEDAL GIVES MAXIMUM BRAKING AND NO TRANSFER OF POWER TO THE TRANSAXLE. PARTIAL PEDAL DEPRESSION ALLOWS TRACTOR TO “CREEP” OR TO REGAIN FORWARD MOTION AFTER STOPPING MIDWAY ON AN UPHILL CLimb.

TO STOP
Depress clutch/brake pedal to stop tractor. To stop drive motor, turn key switch to “Off”.

TO REVERSE
1. Stop tractor by fully depressing clutch/brake pedal.
2. Move range selector to reverse, “R”, position.
3. Slowly release clutch/brake pedal.

NOTE:
NEW POWER PACKS HAVE A “BREAK-IN” PERIOD. IT IS RECOMMENDED THAT DEEP DISCHARGING BE AVOIDED FOR THE FIRST 5 OPERATIONAL PERIODS. THIS WILL ASSURE LONGER POWER PACK LIFE. DEEP DISCHARGING CAN BE IDENTIFIED WHEN THE FUEL LEVEL GAGE READS IN THE RED TO THE LEFT OF “E” (ON EGT 100) OR WHEN THE MOWER SPEED SLOWS DOWN ON ANY MODEL.

ATTACHMENTS
Operational information for the 36 inch rotary mower is found on pages 21 through 25 of this manual. Tractor attachments or accessories are found in the specific manual or instruction sheet supplied with that unit.

NOTE:
The rear pin hitch is provided for light hauling only. Heavy hauling or impact pulling, should not be attempted with the EGT80 or EGT100 model tractor.
UNDER NO CIRCUMSTANCES SHOULD AUTOMOTIVE ELECTRICAL EQUIPMENT SUCH AS LIGHTS, HORNS, OR ANY GROUNDED FRAME DEVICE BE ATTACHED TO THE ELEC-TRAK TRACTOR. THE TRACTOR FRAME IS NOT GROUNDED AND SUCH DEVICES COULD CAUSE DAMAGE TO THE CONTROL SYSTEM AND A POTENTIAL SAFETY HAZARD IF USED.

TRACTOR KEY SWITCH

The key switch “Off” position disconnects all electrical circuits with the exception of the charger, and accessory receptacle on EGT100 only. These circuits are active with the key in either the “Off” or “On” position. The clockwise “On” key position allows power to be applied to the drive and mower motors. The drive motor is started by depressing the clutch/brake pedal and the mower motors can then be started by moving the PTO switch to “Start”.

RANGE SELECTOR

Figure 3

FIG. 3 - RANGE SELECTOR

Range selector lever position determines one of three forward speeds and one reverse according to the pattern shown in Figure 3.

Range selection is made with the clutch/brake pedal depressed, with a quick positive hand motion, but only after tractor motion has stopped.

NOTE:
WHEN RANGE SELECTOR GEARS DO NOT MESH IMMEDIATELY, SLIGHTLY RELEASE THE CLUTCH/BRAKE PEDAL, THEN WITH THE LEVER IN NEUTRAL POSITION DEPRESS AGAIN AND MOVE THE LEVER TO THE POSITION DESIRED. THIS WILL REPOSITION THE GEARS AND ALLOW SHIFTING. DO NOT FORCE GEAR CHANGES IF ANY INTERFERENCE IS INDICATED.

OPERATION AND ADJUSTMENT

MANUAL LIFT

Figure 4

FIG. 4 - MANUAL LIFT

The manual lift is used to raise and lower the mid-mounted mower and other attachments that may be connected to it. The lift handle, mounted just to the right of the control cabinet, is drawn towards the rear of the tractor to raise the mower. Lowering is accomplished by drawing the handle back slightly and depressing the release button before moving the handle forward. (See Figure 4). Notice that to raise the mower it is not necessary to press the release button.

P.T.O.
SWITCH

Figure 5

FIG. 5 - PTO SWITCH

The control cabinet-mounted PTO switch “A” controls mower motor power and power to the PTO receptacle if the tractor is so equipped (EGT100).

Before this circuit is operative, the drive motor must be started in the normal manner. With the attachment properly installed and the drive motor running, the PTO switch is held in the “Start” (up) position momentarily. When the switch handle is released, it automatically returns to the center “Run” position. To interrupt attachment power, move the PTO switch to the “Off” position.
FUEL LEVEL GAGE

- Standard On EGT100.
- Optional on EGT80
- Order Repair No. 120626.

FIG. 6 - FUEL LEVEL GAGE

On the fuel level gage "A" the green zone between the "E" (empty) and "F" (full) represents the range of the power pack. Readings in this zone are fractional portions of full-range remaining.

When the charger is in operation and nearing completion of its cycle, the "CHG" zone indicates the power pack is being fully charged. This assures you of proper charger operation. After the charging cycle is completed, the indication should be "F" or higher, to be interpreted as "full". Use of heavy work attachments or high loads on the tractor will cause the indicator needle to drop below "F" as the heavy drain period begins. The fuel level gage will always read lower during heavy power usage. When the gage consistently reads below empty, the load should be reduced until the indicator needle returns to the green area or the tractor is recharged enough to permit further operation.

While the right red zone represents "overcharge", the left one represents "overdischarge". If either of these zones are indicated after charging, check the trouble-shooting tips on page 4. If proper operation is not restored by the suggestions there, consult your dealer.

FIG. 7 - CLUTCH/BRAKE PEDAL

The clutch/brake pedal provides multiple functions. Initial depression of the pedal starts the drive motor and causes a clutching action which partially disengages the motor from the transaxle. This permits smooth starting and "creeping", ability for maneuvering. As the pedal approaches full depression, the motor is fully disengaged and brake action begins.

The tractor is started by turning the key switch to "On" and then depressing the clutch/brake pedal to start the drive motor. Move the range selector to the desired position and slowly release the clutch/brake pedal. When tractor motion occurs, fully release pedal.

NOTE:
THE CLUTCH MAY BE USED FOR SPEED CONTROL FOR SHORT PERIODS BUT TO PROLONG THE LIFE OF THE DRIVE BELT, FULLY RELEASE THE CLUTCH/BRAKE PEDAL WHENEVER POSSIBLE. IF THE TRACTOR SPEED IS EXCESSIVE, MOVE RANGE SELECTOR TO A LOWER GEAR.
FIG. 8 - PARKING BRAKE

The parking brake lever is mounted under the rear fender just above the left foot rest. This brake operates in conjunction with the clutch/brake pedal; therefore, to engage the parking brake, it is necessary to fully depress the clutch/brake pedal and hold the parking brake lever down while the pedal is released. When foot pressure is released, the pedal should remain in its depressed position.

The parking brake is released by reapplying pressure on the clutch/brake pedal and allowing the parking brake lever to move up. Spring loading returns the parking brake to its “Off” position automatically when the brake pedal is fully depressed.

ACCESSORY RECEPTACLE

Voltage to this receptacle is always on regardless of key switch position. In the event that a power tool does not operate, be sure that the manual circuit breaker button under the hood is pushed in. See Figure 11.

NOTE

THE 36-VOLT ACCESSORY RECEPTACLE IS DESIGNED TO PREVENT THE USE OF STANDARD 115-VOLT AC POWER TOOLS. USE ONLY APPROVED 36-VOLT TOOLS IN THE ACCESSORY RECEPTACLE.

SAFETY INTERLOCKS

SEAT SWITCH

FIG. 9 - ACCESSORY RECEPTACLE

ACCESSORY RECEPTACLE
- Standard on EGT100.
- Optional on EGT80.
- Order Repair No. 120625.

FIG. 9 - ACCESSORY RECEPTACLE

The accessory receptacle “A” on the ELECTRIC tractor lets you take your power source to your work. A variety of 36-volt electric power tools made just for the ELECTRIC tractor to make your home, yard, and garden chores easy and enjoyable are available from your ELECTRIC tractor dealer.

The accessory receptacle is located on the operator side of the control cabinet under the PTO switch as shown. The accessory plug is inserted in the receptacle and turned clockwise slightly to lock it in place.

FIG. 10 - SEAT SWITCH

The seat must be occupied in order to close a switch “A” which permits power to be applied to the drive motor and PTO circuitry when normal starting sequences are followed. If the seat is vacated for any reason, all power circuits are shut off. The key and PTO switch should be used for turning off power in all normal operation.

RETURN-TO-OFF

If power to the PTO circuits is interrupted by the seat switch or turning the key switch to “Off”, it cannot be restored unless the drive motor is restarted and the PTO switch turned to “Start” (fully up) and then “Run”.

If power is interrupted to the drive motor, the clutch/brake pedal must be fully depressed to restart.
POWER PACK CARE AND CHARGING

NOTE:
THE ELECTRIC TRACTOR SHOULD BE PLUGGED IN AND BROUGHT TO THE FULL CHARGE STATE AS SOON AS THE OWNER TAKES DELIVERY.

POWER PACK CARE AND CHARGING

Batteries are one of man's oldest and most reliable sources of power. By following a few basic rules you can expect excellent service and long life from the advanced ELECTRIC tractor power pack.

The power pack is like a tank of energy. When using the tractor, this energy is drained. The charger replaces the used energy by properly converting and metering your household electricity into the power pack. The charger is designed to restore full charge to the power pack after one cycle of operation. Under normal conditions a full charge is nearly reached after 5 hours; however, the charger runs up to 19 hours to equalize cell voltages (when started on the "A" position. Older power packs require less charging time.)

The charger runs independently of the key switch. It is suggested that the key be removed to prevent unauthorized use of the tractor.

CHARGER STARTING POSITIONS

The amount of charging the power pack needs is dependent on:

1. Accumulative number of hours of operation since the last charge.
2. Temperature of tractor storage area.
3. Age of the batteries.

The charger dial starting positions A through J vary the charging period from very long at A to about half as long at J with numerous starting positions in between. The best indicator of the power pack's charging requirements is the amount of water to be added. If water must be added after one to three charges, the charger knob should be started at the next letter below that of the previous charge. The charger setting should not be varied more than one letter at a time, and two or more charges should be made before determining the need to use new knob setting.

As the batteries age and go through more charging cycles, the charging period can be decreased. Typical homeowner use allows a full charge to occur if started in the "A" to "D" position during the first to second year and "D" to

NOTE:
THESE SAFETY INTERLOCKS ARE USED TO ENSURE MAXIMUM SAFETY FOR THE OPERATOR OF THE ELECTRIC TRACTOR. THEY SHOULD NEVER BE ALTERED AND SHOULD ALWAYS BE KEPT IN GOOD WORKING ORDER.
used between the plug and receptacle with the ground lead permanently fastened to the ground screw on the outlet or other tested ground on your electrical system.

In older homes equipped with original electrical wiring, the receptacle cover plate screw may not provide a ground connection when used with an adapter plug. If there is any doubt concerning the ground of your receptacle, consult your dealer or a qualified electrician.

NOTE:
THE POWER PACK SHOULD NOT BE CHARGED IN AN AREA WHERE THE TEMPERATURE IS ABOVE 110°F TO PREVENT OVERCHARGING.

POWER PACK WATERING

During the late stages of the charging cycle, there is a bubbling action or gassing process which allows some water in the electrolyte solution to evaporate. Remember that during this charging procedure only water is lost; so it is only necessary to add water to bring up the electrolyte level to the proper point. Distilled water or tap water that is low to average in mineral content is satisfactory for use in the power pack.

Water should be added only after the power pack is charged. The only exception to this rule is if the water level should fall below the top of the plates. Sufficient water should be added to bring the electrolyte level just above the plates. The system should then be charged, and if necessary additional water added after charging. (This is because the electrolyte expands during charging.)

NOTE:
PWR PACK ELECTROLYTE CAN CAUSE IRRITATION OF THE SKIN AND MAY DAMAGE CLOTHING. ANY CONTACTED ELECTROLYTE SHOULD BE IMMEDIATELY NEUTRALIZED WITH A SOLUTION OF BAKING SODA AND WATER, OR WASHED THOROUGHLY WITH SOAP AND WATER.

Any electrolyte running out of the top of the cells is an obvious sign of overfilling. It is important that the electrolyte level be maintained 1/4-3/8 inch above the plates and never above the indicator ring. Overfilling can result in dilution of electrolyte, which reduces capacity and life of the power pack. Overfilling can also cause corrosion where spillage of electrolyte occurs. (Your Avco New Idea dealer has an automatic water filler jug available at a low cost.)
Under normal conditions it only will be necessary to check the electrolyte approximately once per month. Use of the tractor in higher temperature locations or under very heavy use may require more frequent checks of the level. Also, after several years of use, it may be necessary to add water more often.

NOTE:
THE CHARGING PROCESS EVOLVES SMALL AMOUNTS OF HYDROGEN GAS; THEREFORE, NORMAL PRECAUTIONS LIKE THOSE FOR GASOLINE REFUELING SHOULD BE USED WHENEVER THE ELECTRIC TRACTOR IS BEING CHARGED. (NO SPARKS OR OPEN FLAMES NEAR THE TRACTOR.) THIS GAS CONCENTRATION WILL NOT OCCUR IF THERE IS FREE AIR CIRCULATION IN THE AREA WHERE THE TRACTOR IS STORED OR IF THE AREA IS LARGE SO THE CONCENTRATION IS REDUCED (I.E., A GARAGE).

COLD WEATHER POWER PACK CARE

The efficiency of a power pack is somewhat less at lower temperatures. In order to obtain optimum performance of your ELECTRIC tractor during the winter months, and to properly care for the power pack when not in use, the following recommendations should be followed:

TRACTOR IN STORAGE

1. Fully charge power pack by setting charger knob to appropriate starting position as explained on page 11, and letting charger operate until it shuts off.

2. Add water to each cell of the power pack to the specified level as described in the previous section. It is important for best power pack care to be sure (a) that the perforated plates which may be seen through the filling holes are covered by the electrolyte level to a depth of 1/4-3/8” before charging, and (b) that the level is brought to the bottom of the indicator ring after charging. In this way, overfilling is prevented but sufficient water is assured.

3. The tractor may be stored in the cold, provided the power pack is charged. A discharged power pack can freeze in cold temperatures unless recharged immediately after use. The following table illustrates the relationship between amount of charge and freezing temperature of the electrolyte.

<table>
<thead>
<tr>
<th>Amount of Charge</th>
<th>Freezing Temperature of Electrolyte</th>
</tr>
</thead>
<tbody>
<tr>
<td>100%</td>
<td>-80°F</td>
</tr>
<tr>
<td>75%</td>
<td>-42°F</td>
</tr>
<tr>
<td>50%</td>
<td>-16°F</td>
</tr>
<tr>
<td>25%</td>
<td>-2°F</td>
</tr>
<tr>
<td>10%</td>
<td>+ 7°F</td>
</tr>
</tbody>
</table>

Self-discharge of a fully charged power pack is practically non-existent below 40 degrees Fahrenheit, and it can be stored for several months without attention when not used in any temperature less than 40°F.

4. If stored in a warm area above 40°F, the tractor should be recharged and the water level in the power pack checked and adjusted about once a month.

5. After storage of more than a few weeks, it is advisable to give the power pack an overnight charge before using.

TRACTOR IN USE

1. Parking the tractor in a garage or enclosed building is recommended to reduce extreme low temperature and snow exposure. If stored outside, a tractor cover should be used to enclose and protect the tractor.

2. Start the winter in good condition by following steps 1 and 2 as previously outlined under “Tractor in Storage”.

3. Whenever possible, give the power pack another charge before using if cold weather operation can be predicted. (The night of the snow storm if you plan to remove snow in the morning.)

4. Do not let the power pack stay discharged in cold weather. As soon as the work is completed, recharge the power pack. If idle time occurs between start and finish, plug charger into outlet and let the power pack charge while you are not using the equipment, even if only a few minutes. (This is helpful in any weather to give maximum range and performance.)

5. There is little danger of overcharging the power pack when it is cold, so extra charging in the winter is advisable when the use is expected within the next 24 to 36 hours.

MAKE IT A HABIT! REMOVE KEY • PLUG IN • START CHARGER
VISUAL INSPECTION

Periodic inspection of the tractor is an important preventive maintenance measure. Make it a habit to visually check for loose fastening devices or any evidence of abnormal operation. Inside storage or covering of the tractor will also give longer protection to the tractor.

Adjustments, inspections, and maintenance procedures on both the tractor and attachments should be performed at regular intervals to assure trouble-free, economical operation.

POWER PACK

In addition to power pack charging and watering as outlined, other services may be performed to give more desirable service.

Check the electrolyte level in the power pack monthly. Add water only if necessary. To protect your warranty, no addition of electrolyte should be done, except by your dealer.

City tap water or water of a low to average mineral content is acceptable for refilling. To prevent contamination of water, use the recommended water-filling jug or clean glass or plastic containers with a funnel.

It pays to keep the power pack covers clean. Removal of accumulations of dirt, grass clippings, and so forth will assure optimum electrical system performance. An occasional wiping with wet paper toweling is usually sufficient, or the power pack can be flushed off with water which will drain out at bottom of tractor.

NOTE:
FOR PERSONAL AND EQUIPMENT PROTECTION, ALWAYS UNPLUG CHARGER WHEN CLEANING AND FLUSHING POWER PACK SURFACES.

ELECTRIC CIRCUITRY

The bulk of the ELECTRIC tractor electric circuitry is used for power control and switching and is located primarily in the control console. Service in this area should only be performed by your dealer.

STEERING ASSEMBLY

The front axle and steering system of the ELECTRIC tractor are extremely rugged. Toe-in, and steering gear and linkage are carefully adjusted at the factory and should require no additional adjustments in normal service, barring improper operation. If any service becomes necessary, contact your dealer.

TIRES AND WHEELS

Proper tire inflation pressure is an important factor in determining tire life. Pressures should be checked and corrected, if necessary, on a monthly basis according to the following table.

<table>
<thead>
<tr>
<th>Front</th>
<th>Soil or Snow</th>
<th>Hard Surface</th>
</tr>
</thead>
<tbody>
<tr>
<td>10-15 psi(1)</td>
<td>15-28 psi(2)</td>
<td>10-24 psi</td>
</tr>
<tr>
<td>Rear</td>
<td>8-10 psi</td>
<td></td>
</tr>
</tbody>
</table>

Pressure measurement should be made with a low-pressure gage which can be purchased from your dealer.

Use with chains requires the lowest pressures for smoothest ride and maximum traction.

Stumps, holes, and sharp objects should be avoided, and any cuts occurring in the tires should be repaired immediately or tire life will be reduced.

USE OF CHAINS

Chains on the rear tires will be found helpful on loose or soft surfaces. The mower must be removed while using chains.

To facilitate installation of the chains, the rear of the tractor should be lifted and the chains placed over the tire and connected at the bottom side, or the wheels can be removed as instructed on page 14, for chain installation.

Do not allow excess chain to rub or contact tractor body or frame.

FRONT WHEEL REMOVAL

Figure 13

Remove front wheels by removing snap ring, flat washer and sliding wheel off of axle.
FIG. 14 - REAR WHEEL REMOVAL

The rear wheels are secured to the rear axle by clevis pins “A” which pass through holes in the wheel extension tube (inside) and matching holes in the axles. To remove the rear wheels, jack up the rear of the tractor and remove the cotter pins which retain the clevis pins. The clevis pins can then be removed easily and the wheels can be removed from the axles. To remount wheels, align cross holes of wheel centers with the corresponding holes in the axles by inserting a small pointed tool such as a punch or nail. This will ease installation of the clevis pin.

1. Lower pressure will soften the ride and improve traction.
2. The higher tire pressure will decrease rolling resistance and extended use range on paved or other hard surfaces. (This does not apply to use with chains on hard surfaces.)

BRAKE & PARKING BRAKE ADJUSTMENT

FIG. 15 - BRAKE AND PARKING BRAKE

A fully depressed brake pedal or an engaged parking brake should prevent the tractor from rolling on average hillsides. If the brake does not perform satisfactorily, the following adjustment may be made:

1. Remove the key and turn the charger off.
2. Block the front wheels and move the range selector to neutral.
3. Jack up the rear of the tractor and remove the right rear wheel.
4. Loosen the jam nuts “A” on the forward end of the brake rod and thread the nuts toward the brake caliper “B” to increase braking action. One to two turns of the rear jam nut from its original position is usually sufficient to give satisfactory adjustment.
5. Hold the rear jam nut while tightening the forward one to secure adjustment.
6. Check to be sure there is no brake drag by rotating the brake disk “C” manually.
7. Test brake function and readjust if necessary.
8. Replace rear wheel with pin.

DRIVE ASSEMBLY
**FIG. 16 - DRIVE ASSEMBLY**

Power is transmitted from the drive motor to the transaxle through a heavy-duty, direct-coupled belt “A”. The belt should be kept free of grease, oil, electrolyte and dressings, and checked occasionally for tightness to assure best performance. If the belt becomes contaminated it should be wiped with a clean cloth. Any belt slippage is due to moisture or loose adjustment. If the belt becomes wet and slips, temporarily select a lower speed range (higher torque) until the belt dries, and then resume normal operation.

Check Clip “B”, parking brake stop, is set properly.
Check shield “C” so it does not rub on belt pulley.

**TRANSAXLE**

AFTER EACH 100 OPERATING HOURS--OR EVERY SIX MONTHS

After 100 operating hours, the transaxle filler plug “A” should be removed and the fluid level checked. The oil level should be to the bottom edge of the filler hole at “A”. If necessary replenish with approved axle fluid only; i.e., SAE EP90.

If oil becomes excessively dirty, remove drain plug “B”. Drain oil and replace with new oil SAE EP90.

**Figure 18**

Fig. 18 - Twice a year or every 100 operating hours the following should be greased:

A. Spindles
B. Pivot Pins

Use a No. 2 multipurpose lithium grease. Wipe off all excessive grease.

Oil the following points with heavy duty No. 30 machine oil:
1. Clutch/brake pedal pivot pin and linkage connections.
2. Hood and seat hinges.
4. Lift assembly pivot pins.
5. Idler pulley assembly.

Prevent dirt and dust accumulation by wiping away all excess oil.

These lubrication intervals are meant to be a guide only. If the tractor is subjected to abnormal environmental conditions or greater-than-average use, the frequency of lubrication as well as other preventive maintenance measures should be adjusted accordingly.
STORAGE AND ASSEMBLY PROCEDURE

STORAGE

Your tractor should be covered or under a roof in outside storage in snowy or rainy weather to give better protection and maintain performance and life of the equipment. Storage covers are available from your dealer which are custom tailored for your ELECTRIC tractor.

Seasonal storage requires a minimum of preparation. The steps to be performed are as follows:

1. Wherever possible, store tractor in a cool, dry weather-protected area or cover with the storage cover.
2. Clean power pack covers if necessary as outlined on page 13.
3. Plug charger into approved receptacle and start charger operation. Insure proper water level after first day (24 hours). (See page 10.)
4. Lubricate tractor and wipe oil on any parts that may be affected by rust.
5. Recycle the charger operation monthly.

The charge retention (without using additional electricity for recharging) of the power pack can be extended considerably if stored in a very cool place. Lower temperature slows the self-discharge. At temperatures below 40°F, virtually no self-discharge occurs.

NOTE:
AT TEMPERATURES BELOW 32°F THE FULL CHARGE STATE MUST BE MAINTAINED TO PREVENT CELL ELECTROLYTE FROM FREEZING WHICH MAY RESULT IN PERMANENT DAMAGE TO POWER PACK.

ASSEMBLY - EGT 80 AND 100

1. Cut the banding straps and remove the upper portions of the carton. Cut the sides of the bottom tray so the tray lays flat.
2. Remove the wheel-tire assemblies and loose boxes from the carton. Also remove loose packing material in the area of the front axle. Inspect the contents of all packages.

REAR WHEELS

Figure 19

Fig. 19 - Grease the rear axle shaft to prevent rust formation, and install the rear wheels with the extended portions of the wheels' centers toward the tractor. Align the cross-holes of the wheel centers with the corresponding holes in the axle. Insert clevis pins "A" in the holes and secure with cotter pins. (See Figure 19.)

3. Jack up the rear of the tractor.
4. Remove the mower deck and rear cardboard support from below the tractor frame.

NOTE
THE SUPPORT CAN BE PARTIALLY DISASSEMBLED IN PLACE FOR EASE OF REMOVAL.

FRONT WHEELS

Figure 20

Fig. 20 - Install front wheels by sliding wheel onto axle and secure with flat washer and snap ring at "B".
Fig. 21 - 1. On EGT 80 install the woodruff key and steering arm "A" (boss extending downward) on the lower end of the steering shaft below the frame so the boss is flush with the end of the shaft. Secure with the squarehead setscrew.

On EGT 100 install steering arm "A" (boss extending downward) with roll pin.

2. Install the short tie rod "B", between the steering arm tab on the lower end of the steering assembly and the Pitman arm which is attached to the right-front-wheel spindle. Install so the threaded studs of the ball joints extend down through the arm tabs. Secure with lockwashers and nuts.

3. Install the long tie rod "C" so the threaded studs of the ball joints extend up through the spindle tabs. Secure with lockwashers and nuts.

Fig. 22 - 1. Place the plastic sleeve over the upper end of the steering shaft with its slotted end upward and aligned with the holes in the steering shaft.

2. Place the steering wheel on the shaft so its holes align with those of the shaft. Drive the spring dowel pin "A" in the aligned holes. Snap the monogram cap into the center of the steering wheel.

Fig. 23 & 24 - Hole spacing "A" in seat mounting is for your convenience. Center hole setting is for average size operator. After setting has been determined install rope "B" to seat mounting.

Install seat to seat mounting Fig. 24 using four (4) 5/16 x 1" machine bolts and flatwashers at "C".
BATTERY INSTALLATION
EGT 80
USE (3) 12 VOLT BATTERIES

NOTE:
TO INSURE PROPER TRACTOR OPERATION,
CHECK ALL BATTERIES, PRIOR TO IN-
STALLATION, FOR CRACKS, DEFECTS,
POLARITY AND ELECTROLYTE LEVEL.
AVOID TOUCHING TOOLS OR CABLES TO
THE TRACTOR Frame WHILE INSTALLING
AND CONNECTING BATTERIES.

Figure 26

5. Place a thin vacuum-formed battery protector
between the poly bag and the rear wall of the
compartment and a thick protector in similar
fashion at the front of the compartment. Position
the protectors so their corrugations will
face the battery walls. (See Figure 26.)

6. Connect the battery cables in accordance with
Figure 26. Observe clamp polarity markings.
Coat the terminals after connections are made
with a thin film of Battery Terminal Protective
Grease. Make sure all surfaces are coated!

Figure 27

7. Place the plastic cover over the batteries, but
inside the top edges of the bag, making sure
the battery cables go through the end slots of
the cover, and that the center cables fit into
the center raised portion of the cover. (See
Figure 27.)

8. Place the hold-down angle clamps “C” along
the sides of the battery cover, outside the top
edges of the bag so the bag is between the
cover and the clamps. (See Figure 27.) Notice
there is a right and left clamp.
NOTE:
ENGAGE THE REAR OF EACH CLAMP IN THE CORRESPONDING SLOT IN THE PANEL IN THE REAR OF THE COMPARTMENT, AND THEN LOWER THE CLAMP INTO POSITION.

9. Secure the front of each clamp to its corresponding threaded stud with a lockwasher and nut.
10. With Model EGT 80, check that wires numbered 10 and 12 are connected to the seat switch which is mounted on the cross-bar over the rear compartment.

NOTE:
HEAVY DUTY BATTERY CONVERSION KIT 080-0007 IS AVAILABLE ON ALL EGT 80 UNITS. THIS CONVERSION KIT WILL GIVE ADDED EXTENDED RANGE PER CHARGE.

BATTERY INSTALLATION
EGT 100
USE (6) 6 VOLT BATTERIES

CAUTION:
TO INSURE PROPER TRACTOR OPERATION, CHECK ALL BATTERIES, PRIOR TO INSTALLATION, FOR CRACKS, DEFECTS, POLARITY AND ELECTROLYTE LEVEL. AVOID TOUCHING TOOLS OR CABLES TO THE TRACTOR FRAME WHILE INSTALLING AND CONNECTING BATTERIES.

4. Carefully set three batteries in the bag as shown in Figure 28 observing polarity markings. Make sure the sides of the bag remain above the top surface of the batteries in equal amounts. (It may help to tape the upper edges of the bag to the tractor sides temporarily to permit easy insertion of the batteries.)

FORWARD COMPARTMENT

Fig. 28 - 1. Remove all loose parts from the forward battery compartment. Turn the key switch counter-clockwise to the “Off” position.
2. Place one of the plastic trays in the bottom of the forward battery compartment so its drain hole lines up with the drain hole in the floor of the compartment.
3. Unfold one of the poly bags and place it in the tray so the bag’s bottom seam runs from front to rear. Flatten the pockets that form at the seam ends so the bottom of the bag conforms to the tray.

5. Place one of the long, vacuum-formed, battery protectors along each side of the poly bag (outside) so the corrugations will face the battery walls. (See Figure 28.)
6. Place the short sections of battery protectors in similar fashion at the ends of the compartment with the thicker one at the front as shown in Figure 28.
7. Connect the battery cables in accordance with Figure 28. Observe clamp polarity markings. Coat the terminals, after connections are made, with a thin film of Battery Terminal Protective Grease. Make sure all surfaces are coated!
ASSEMBLY PROCEDURE

8. Place the plastic cover over the batteries, but inside the top edges of the bag, making sure the battery cables go through the end slots of the cover, similar to Figure 27.

9. Place the longer pair of hold-down angle clamps along the sides of the battery cover outside the top edges of the bag so the bag is between the cover and the clamps. See Figure 27. Notice there is a left and right clamp.

NOTE:
ENGAGE THE REAR OF EACH CLAMP IN THE CORRESPONDING SLOT IN THE PANEL IN THE REAR OF THE COMPARTMENT AND THEN LOWER THE CLAMP INTO POSITION.

10. Secure the front of each clamp to its corresponding threaded stud with a lockwasher and nut.

REAR COMPARTMENT

Fig. 29 - 1. Remove all loose parts from the rear battery compartment.
2. Adjust the wiring entering the rear compartment so it will not interfere with battery installation or be inaccessible when needed.

3. Temporarily remove the cross-bar "A" which is mounted over the rear battery compartment. Swing the compartment cover completely open and protect the paint with cardboard where the rear edge of the cover touches the outside of the rear compartment.

4. Place the battery tray in the bottom of the rear compartment so its drain hole lines up with the drain hole in the floor of the compartment.

5. Unfold the remaining poly bag and place it in the tray so the bag's bottom seam runs from front to rear. Flatten the pockets that form at the seam ends so the bottom of the bag conforms to the tray.

6. Carefully set the batteries in the bag as shown in Figure 28 so that the sides of the bag remain above the top battery surface in equal amounts and all wires are accessible.

7. Place one of the long vacuum-formed battery protectors along each side of the poly bag (outside) so its corrugations will face the battery walls. (See Figure 28).

8. Connect the battery cables and wires in accordance with Figure 28. Coat the terminals after connections are made with a thin film of Battery Terminal Protective Grease. Make sure all surfaces are coated!

9. Place the plastic cover over the batteries, but inside the top edges of the bag, making sure the battery cables go through the end slots of the cover.

10. Remount the cross-bar "A", Fig. 30 over the rear compartment so the seat switch is towards the back of the tractor.

11. Place the hold-down angle clamps "B" along the sides of the battery cover, outside the top edges of the bag so the bag is between the cover and the clamps, Fig. 30. Notice there is a left and right clamp.

NOTE:
ENGAGE THE FRONT OF EACH CLAMP IN THE CORRESPONDING SLOT IN THE FRONT OF THE COMPARTMENT AND THEN LOWER THE CLAMP INTO POSITION.

12. Secure the rear of each clamp to the compartment wall with a 1/4-20 bolt, lockwasher and nut so the head of the bolt is on the outside of the compartment.

13. Check that wires numbered 10 and 12 are connected to the seat switch which is mounted on the cross-bar over the rear battery compartment.

14. Charge batteries initially as instructed on page 10.
NOTE: DO NOT READJUST MOWER SUSPENSION ARMS

1. Mount motor “A” (closest to the side discharge opening) with its wire box towards the front of the mower. Mount motor “B” so its wire box is towards the rear of the mower. Secure each motor with four screws, lockwashers, and nuts with the screw heads on the top side of the deck. (See Figure 31.)

2. Install a motor bracket “C” on the underside of each deck-mounted angle support so that their tabs are flush with their motor’s sides and directed upwards as shown in Figure 32. Secure with 1/4-20 x 3/4 inch bolts inserted from the top side with a washer, lockwasher and nut below each support. Finger tighten each nut.

3. Install a motor clamp around each motor so that it engages its corresponding bracket tab. See Figure 32. While holding the clamp parallel with the mower deck, tighten the clamp screw. Locate the screw toward the angle support to be inconspicuous when the mower is assembled to tractor. After the clamps are tightened, tighten the nuts holding the motor brackets to the angle supports.

5. Install wheel assembly “E” in the lowest adjusting hole on each rear corner of the mower. This adjustment gives maximum cutting height for initial mowing passes. Install wheel in the following manner: Flatwasher next to bolt head, wheel, spacer, install wheel assembly through frame and secure with 3/8” lockwasher and nut.

Fig. 33 - 1. All EGT 80 Mowers are equipped with standard low profile blades. If the Heavy Duty Conversion Kit 080-0007 is installed then a high profile blade should be used. A high profile blade gives a high discharge velocity and the low profile blades give extended mowing range with lower discharge velocity. Install in pairs only.
ASSEMBLY PROCEDURE

Figure 34

Fig. 34 & 35 - Place blades “A” so the cutting edge is in the proper direction for rotation. Install blades as shown in Fig. 35. Tighten each self-locking cap screw to approximately 21 foot pounds of torque. Make sure the square key stays in place when installing each clutch hub.

MOWER ATTACHING POINTS

Figure 36

Figure 35

Install guards “B” using 1/4 x 5/8” machine bolts in rear holes and 1/4 x 5/8” previously installed in shield “D”, Fig. 31. Tighten all bolts.

SUSPENSION ARM

Figure 37

BALL ROD END
JAM NUT

12”
DO NOT READJUST UNLESS DIMENSION IS INCORRECT
ASSEMBLY AND ADJUSTMENT PROCEDURE

MOWER ATTACHMENT

Fig. 36 & 37 - Attach the mower to the tractor in the following manner.

1. Drive the tractor to a flat level area, and remove the key, place the range selector in “L” and release the parking brake to give maximum clearance under the frame.
2. Place the mower under the tractor in its approximate mounted position.
3. Insert all four suspension arms “A” in their respective frame bushings so their lower ball rod ends lay on the mower deck near their mounting pins. Do not readjust suspension arms. These are factory adjusted as shown in Fig. 37.

NOTE:
THE REAR SUSPENSION ARM ON THE CLUTCH/BRAKE PEDAL SIDE MUST BE INSTALLED INSIDE OF THE LONG, 1/4 INCH, STEEL ROD WHICH CONNECTS THE CLUTCH/BRAKE PEDAL TO THE IDLER ARM. THE INSIDE OF THIS ROD IS THE SIDE TOWARDS THE CENTER OF THE TRACTOR.

4. Attach the ball rod ends of both suspension arms on the left (clutch/break pedal side). Secure with hair pin cotter.
5. Attach the remaining suspension arms in similar fashion.
6. Move the manual lift handle fully-forward and attach both lift cables to their corresponding lift pins “B” on the mower deck. Secure with plain washers and hair pin cotters.

7. Join each mower-motor power-cord-connector “C” to its corresponding power cord exiting bottom of frame.

NOTE
THE CONNECTOR HALVES ARE KEYED TO FIT TOGETHER ONLY ONE WAY TO ESTABLISH PROPER POLARITY. TO PREVENT PINCHING OF THE MOWER-MOTOR POWER CORDS, THEY SHOULD BE ROUTED UNDER THE ANGLE SUPPORTS TO WHICH THE SUSPENSION ARMS ARE ATTACHED. TO PROVIDE MAXIMUM PIN CONTACT, MAKE SURE POWER CORD CONNECTORS ARE JOINED TIGHTLY.

8. Oil all lift pivot points and mower rear wheel bearings.
10. Make an operational check of the tractor and mower.

Removal of the mower follows the same steps in the reverse order.

After removal of the mower, carefully store the washers, hair pin cotters, and suspension arms in the location from which they were removed for safekeeping.

NOTE:
ALWAYS DISCONNECT BOTH PAIRS OF MOTOR POWER CORD CONNECTORS BEFORE HANDLING THE MOWER FOR ANY REASON.

ADJUSTMENTS

The rear mower wheels are the only part that requires adjustment. Make adjustment as follows (Figure 31):

1. Disconnect both pairs of motor power cord connectors.
2. Raise the mower to the uppermost position.
3. Remove the center bolt of each rear wheel.
4. Relocate the wheel center bolts in the desired position.

NOTE:
The upper adjustment hole gives the lowest cutting height and the lowest hole gives the maximum lawn cutting height. The other adjustment holes allow intermediate cutting heights in 1/2-inch increments.

5. Secure the wheel assemblies in desired position with lockwashers and nuts, making sure each wheel uses a similar mounting hole to keep the mower level.
6. Reconnect the motor power cords.
The operator must be seated on the tractor, the key switch turned to “On”, and the drive motor started (clutch/brake pedal depressed) before the PTO switch can be turned to “Start” to operate the mower. An electrical interlock prevents mower starting if this procedure is not followed. Once the mower is running, if the operator leaves the seat or turns the key switch to “Off”, another interlock operates which not only interrupts mower power, but also stops blade rotation immediately by a dynamic braking action. To restart, with the key “On”, simply restart the drive motor and move the PTO switch to “Start” (fully up) and then to “Run”. For all normal use, the PTO switch should be used to turn the mower off.

"D1" is the best range selector position to use for average to heavy mowing and "D2" may be used for lighter duty, faster mowing. If the cut is not even and clean, a lower range selector position or a higher cutting height should be used. The low ("L") range should be used on steep hillsides for greater control.

When mowing on steep hillsides, the travel should be up and down. Care should be exercised to avoid sudden starts and stops which may cause loss of control. The tractor motor will offer some braking action provided the clutch/brake pedal is not depressed and the range selector is left in gear. The "L" position offers the most motor braking.

CUTTING

Always mow with sharp blades. The blades should be sharpened and balanced seasonally if subjected to average use, or whenever cutting quality deteriorates. Always disconnect the motor power cords before servicing or adjusting the mower. After each sharpening, if mower vibration is noticeable, the blades should be checked for balance. Unbalanced blades will shorten the life of the mower motor bearings.

For good appearance of the mowed lawn, it is very important to have the mower adjusted correctly for height of cut.

The best height of cut should be determined by positioning the rear mower wheels in the second-lowest adjusting holes for the first few passes. If the grass is not cut short enough, use of the third-lowest hole will give a 1/2-inch shorter cut, and so forth. Care must be used not to scalp uneven parts of the lawn by cutting too close.

Experience in operating the equipment under various conditions is very important in obtaining maximum efficiency and the best appearance. After a few hours of operation, mower motor and blade loading can be easily determined by the sound and vibration produced. If the turf is very soft or the grass is very heavy the blade noise and mower vibration may increase signaling the operator of overloading. In this case, it is suggested that the lift lever be drawn back until the weight of the mower is first felt and then to lock the lift in the next higher position. After mowing with the mower in this position, if it is desired to cut the grass shorter, another pass with the mower fully-lowered should be made. If the grass is not too long shifting into a lower range selector position may eliminate the need for raising the mower.

On average lawns that have merely grown too long it may be necessary to mow on two passes in the same manner as described above to prevent clogging of the chute. This would also be the method used to mow very high grass or weeds, but the initial pass should be made with the mower in its highest cutting position.

When sections of rough terrain or an area which may contain small stones is encountered, the operator should constantly adjust the lift lever to the conditions to prevent damage to the equipment or injury to the operator or bystanders.

If the tractor appears to groove the lawn or gives a bumpy ride, check the tire pressure. The pressure should be 8-10 psi rear, and 10-15 front.
GROUND SPEED

Level positioning of the mower is very important for good cutting quality and low power consumption. If a mower motor becomes overloaded due to mowing too fast in high grass, too low or uneven adjustment for grass height, obstructions, clogging, or jamming, that motor may shut off momentarily. This is caused by the opening of a circuit breaker which prevents motor damage. After a short interval for cooling, the circuit breaker will reset automatically and the motor will restart. If the automatic circuit breakers on the mower motors continue to interrupt operation of one or more motors after loading has been reduced, remove the power cord from the PTO receptacle and carefully check the mower adjustment on a level surface. If the mower is level and the cutting height correct, check the blades for obstructions and refer to instructions in “Cutting” section.

MOWER OPERATING AND MAINTENANCE TIPS

- It is recommended that the underside of the mower deck be cleaned frequently to maintain maximum mowing effectiveness and reduce the likelihood of blade clogging. The mower must be removed to facilitate effective cleaning.
- Mowing of high grass may be made by making two passes; the first pass with the mower in its highest position. If there are low obstructions such as twigs or small stones in the mowing area, the second pass should be made with the mower still at a high setting to accommodate the obstructions.
- The mower must be removed when using tire chains to give adequate clearance.
- Sharpen and balance blades as required, but at least seasonally.
- Oil mower wheel axles, and lift pivot points frequently as needed with a 30 weight machine oil as indicated in the “Service” section of this manual.
- Turn to the left as much as possible so that grass clippings will be discharged evenly to the right over grass already cut. Turning to the right causes a build up of grass clippings which prevents uniform cutting and causes an unnecessary load on the mower.
- Turn to the right when beginning to mow large open areas to discharge clippings away from borders such as sidewalks, fences, driveways, etc. After making two or three passes this way, mow in the opposite direction turning to the left to finish. See Figure 38.

Figure 38. Mowing Pattern

- Never mow wet grass as this can cause chute and blade clogging which reduce the cutting effectiveness and overload the motors.
- Listen to motor noise as an indication of loading. If mower motors slow down and the mower deck vibrates because of loading in tall or thick grass, reduce vehicle speed by selecting next lower gear.
